

FERNANDO CHIRIGATI

CURRICULUM VITÆ

CONTACT INFORMATION

NYU Tandon School of Engineering ◦ CSE Department
2 MetroTech Center, 10th Floor ◦ Brooklyn, NY 11201, USA
✉ fchirigati@nyu.edu
🌐 <https://fchirigati.com>

EDUCATION

- Jan 2012 – Aug 2018 **Ph.D., Computer Science**, *NYU Tandon School of Engineering, Brooklyn – USA*.
Advisor: Juliana Freire, Ph.D.
- Jan 2007 – Dec 2011 **B.E., Computer and Information Engineering**, *Federal University of Rio de Janeiro, Rio de Janeiro – Brazil*.
Advisor: Marta Mattoso, D.Sc.
- Aug 2010 – Dec 2010 **One-Semester Exchange Program**, *University of Central Florida, Orlando – USA*.
Scholarship granted by the Brazilian government.

RESEARCH INTERESTS

Data Management ◦ Data Mining ◦ Large-Scale Data Analytics
Provenance Management and Analytics ◦ Reproducibility ◦ Data Visualization

PROFESSIONAL EXPERIENCE

Research project details can be found on the next page.

- Oct 2018 – Present **Postdoctoral Research Associate**
Computer Science and Engineering Department
NYU Tandon School of Engineering, Brooklyn – USA
NYU Center for Data Science, New York – USA
Research Projects: *Streamlining Model Design, Comparison, and Curation; Reproducibility in Science; Saving Data Journalism*
- Jan 2012 – Aug 2018 **Research Assistant**
NYU Tandon School of Engineering, Brooklyn – USA
Supervisor: Juliana Freire
Research Projects: *Urban Data Management and Analytics; Reproducibility in Science*
- May 2016 – Aug 2016 **Summer Research Intern**
New York Structured Data Research Group
Google Research, New York City – USA
Supervisors: Flip Korn and Cong Yu
Research Project: *Understanding Tables on the Web through Automatic Visualizations*

2 MetroTech Center, 10th Floor – Brooklyn, NY 11201, USA
✉ fchirigati@nyu.edu • 🌐 <https://fchirigati.com>

- May 2015 – Aug 2015 **Summer Research Intern**
 New York Structured Data Research Group
 Google Research, New York City – USA
 Supervisors: Flip Korn and Cong Yu
 Research Project: *Enhancing Search Results with Knowledge Carousels*
- Jun 2012 – Jan 2015 **DataONE Working Group Member**
 Scientific Workflows and Provenance Working Group
- Jun 2013 – Aug 2013 **Summer Research Intern**
 IBM T. J. Watson Research Center, Yorktown Heights – USA
 Supervisors: Jérôme Siméon and Martin Hirzel
 Research Project: *Bridging the Gap between Big and Fast Data*
- Jan 2009 – Feb 2009 **Research Intern**
 University of Utah, Salt Lake City – USA
 Supervisors: Juliana Freire and Cláudio T. Silva
 Research Project: *Development of Control-Flow Structures for VisTrails*
- Aug 2007 – Aug 2010 **Research Assistant**
 Federal University of Rio de Janeiro, Rio de Janeiro – Brazil
 Supervisor: Marta Mattoso
 Research Projects: *Data Provenance in Scientific Experiments; Management of Large-Scale Scientific Experiments*

RESEARCH PROJECTS

- Oct 2018 – Present **Streamlining Model Design, Comparison, and Curation**
 NYU Tandon School of Engineering, Brooklyn – USA
Description: Understanding the complex and increasingly data-intensive world around us relies on the construction of robust empirical models, i.e., representations of real, complex systems that enable decision makers to predict behaviors and answer “what-if” questions. Today, construction of complex empirical models is largely a manual process requiring a team of subject matter experts and data scientists. With ever more data becoming available via improved sensing and open sources, the opportunity exists to build models to speed scientific discovery, enhance Department of Defense/Intelligence Community’s intelligence, and improve United States Government logistics and workforce management, but capitalizing on this opportunity is fundamentally limited by the availability of data scientists. This project aims to develop automated model discovery systems that enable users with subject matter expertise but no data science background to create empirical models of real, complex processes. This capability will enable subject matter experts to create empirical models without the need for data scientists, and will increase the productivity of expert data scientists via automation. In the context of this project, we are also interested in how to streamline data augmentation, i.e., how to efficiently find relevant datasets from the Web that can be used to complement the input data of an existing machine learning pipeline to improve the model performance and accuracy.

- Jan 2012 – Present **Reproducibility in Science**
 NYU Tandon School of Engineering, Brooklyn – USA
Description: While reproducibility is a core component of the scientific process, science falls far short of reproducible results. Most computational experiments are specified only informally in papers, where experimental results are briefly described in figure captions; the code that produced the results is seldom available; and configuration parameters change results in unforeseen ways. This project is focused on developing a suite of tools and infrastructure that supports the process of sharing, testing, and re-using scientific experiments and results. In particular, the goal is to assist researchers in streamlining their research process to make their data interoperable and reproducible. ReproZip and noWorkflow are examples of outcomes of the project.
- May 2018 – Apr 2019 **Saving Data Journalism: A Prototype to Enable Systematic Collection & Preservation of Dynamic News Websites**
 NYU Division of Libraries, New York – USA
Description: Storytelling with data has revolutionized modern reporting, and the dramatic increase in the production and popularity of data journalism projects can be seen both at news startups such as FiveThirtyEight and Vox.com, as well as at legacy news organizations like The New York Times, The Washington Post, and The Wall Street Journal. These stories are an important part of the historical record, yet due to their technological complexity, they cannot currently be archived or preserved at libraries, newsrooms, or cultural institutions. As such, they are disappearing. In this project, we propose a prototype to capture one type of data journalism artifact known as “news app” (which are based on dynamic websites) through emulation, which will add to an existing open source computational reproducibility tool, ReproZip. The extension will be designed to quickly and easily pack and unpack dynamic websites, enabling the first large-scale collection, preservation, and discovery of these objects.
- Aug 2014 – Sep 2018 **Urban Data Management and Analytics**
 NYU Tandon School of Engineering, Brooklyn – USA
Description: Discovering relationships between spatio-temporal urban datasets can lead to insights and allow for a better understanding of how the city behaves. Given the sheer number and size of the data sets, and the diverse spatial and temporal scales at which the data is available, this task presents computational challenges on all fronts, from indexing and querying to analyzing the relationships. Also, it is non-trivial to differentiate between meaningful and spurious relationships. This project takes a first step towards addressing these challenges and proposing a solution that is scalable and effective at identifying potentially meaningful relationships.
- May 2016 – Aug 2016 **Understanding Tables on the Web through Automatic Visualizations**
 Google Research, New York City – USA
Description: Tables on the Web, also known as WebTables, are a valuable source of information since they are mostly human-curated, thus representing concepts and facts that are interesting to users in a tabular, semi-structured format. The goal of this project is to use this data to automatically generate visualizations, or charts, that give insightful summaries of the table content and pinpoint interesting facts for users. Different challenges need to be addressed in this project, including providing and using intelligent table annotations to make better sense of the semi-structured data, and ranking the generated charts.

- May 2015 – Aug 2015 **Enhancing Search Results with Knowledge Carousels**
 Google Research, New York City – USA
Description: The increasing popularity of mobile device usage has ushered in many features in modern search engines that help users with various information needs. One of those needs is knowledge exploration, where related documents are returned in response to a user query, either directly through right-hand side knowledge panels or indirectly through navigable sections underneath individual search results. Existing knowledge exploration features have relied on a combination of Knowledge Bases and query logs. In this project, the goal is to generate knowledge carousels to facilitate knowledge exploration with regard to an entity-seeking query, based on leveraging the large corpus of tables on the Web. This brings many technical challenges, including associating correct carousels with the search entity, selecting the best carousel from the candidates, and finding titles that best describe the carousel.
- Jun 2013 – Aug 2013 **Bridging the Gap between Big and Fast Data**
 IBM T. J. Watson Research Center, Yorktown Heights – USA
Description: Increasingly, applications that deal with big data need to run analytics concurrently with updates. But bridging the gap between big and fast data is challenging: most of these applications require analytics' results that are fresh and consistent, but without impacting system latency and throughput. The focus of this project is on designing algorithms and data structures to enable consistent analytics without blocking incoming updates in NoSQL stores.
- Jul 2009 – Aug 2010 **Management of Large-Scale Scientific Experiments**
 Federal University of Rio de Janeiro, Rio de Janeiro – Brazil
Description: Many different scientific areas, including deep-sea oil exploitation and bioinformatics, require simulating large-scale experiments. These simulations must be designed efficiently to avoid the overconsumption of computational resources, as this can become incredibly expensive. In this project, the focus is on building tools to design scientific workflows for such simulations, from its conception to its execution and provenance analysis. The use of provenance data is key in this project: by analyzing ongoing and past executions, previous results can be re-used, thus avoiding expensive, redundant computations.
- Jan 2009 – Feb 2009 **Development of Control-Flow Structures for VisTrails**
 University of Utah, Salt Lake City – USA
Description: While scientific workflows are mostly data-oriented, often represented as directed acyclic graphs, control-flow structures are sometimes required to specify how the data flow should be directed. The goal of this project is to add such control-flow structures to the workflow system VisTrails.
- Aug 2007 – Jul 2009 **Data Provenance in Scientific Experiments**
 Federal University of Rio de Janeiro, Rio de Janeiro – Brazil
Description: As the amount of data becomes massive and the nature of the scientific workflows becomes more heterogeneous, with data and tasks located in a distributed manner, the need for integrating provenance from the different experiment steps becomes more evident. The goal of this project is to propose efficient solutions, developed in scientific workflow systems, to store and analyze such provenance data, while integrating the different pieces into a single queryable store.

AWARDS AND HONORS

- Invitation **7th Heidelberg Laureate Forum**
Only the 200 most qualified young researchers are given the opportunity to attend the Heidelberg Laureate Forum, an event where young researchers can personally meet the winners of the most prestigious prizes in Computer Science and Mathematics.
2019
- Honorable Mention **Best Demonstration – SIGMOD 2017**
Querying and Exploring Polygamous Relationships in Urban Spatio-Temporal Data Sets
2017
- Award **Most Reproducible Paper – SIGMOD 2017**
Data Polygamy: The Many-Many Relationships among Urban Spatio-Temporal Data Sets
2017
- Award **Student Travel Award – SIGMOD 2017**
2017
- Award **Pearl Brownstein Doctoral Research Award – NYU Tandon**
Doctoral research that shows the greatest promise.
2016
- 2nd Place **Programming Contest – SIGMOD 2014**
Together with Tuan-Anh Hoang-Vu, Kien Pham, and Huy T. Vo.
2014
- Award **Deborah Rosenthal, MD Award – NYU Tandon**
Outstanding performance on the Ph.D. qualifying examination.
2014
- Honorable Mention **A3P Special Honor – Federal University of Rio de Janeiro**
Outstanding performance achieved at the Federal University of Rio de Janeiro, given by the Alumni Association of the Polytechnic School (A3P).
2013
- Honorable Mention **Magna Cum Laude Honor – Federal University of Rio de Janeiro**
Outstanding performance achieved in Computer and Information Engineering.
2013
- Honorable Mention **Research Honor – Federal University of Rio de Janeiro**
Given by the Academic Deliberative Council of Graduate Department of Engineering (COPPE).
2010
- Award **Best Poster – XXIV Brazilian Symposium on Databases**
Development of Explicit Control Structures for SWfMS VisTrails (in Portuguese)
2009
- Honorable Mention **Best Presentation – Federal University of Rio de Janeiro**
Top 10 presentations among more than 500 presentations, during the XXXI Conference on Young Research Assistant.
2010

2 MetroTech Center, 10th Floor – Brooklyn, NY 11201, USA

PROFESSIONAL ACTIVITIES

- 2015 – Present **Reproducibility Editor**
Information Systems Journal, Elsevier North-Holland
- 2019 **Program Committee Chair – Data Science Track**
International Conference on Computer Systems and Applications (AICCSA), 2019
- Program Committee Member**
International Workshop on Practical Reproducible Evaluation of Computer Systems (P-RECS), 2019
- 2018 **Program Committee Member – Research Track**
Very Large Data Bases (VLDB) Conference, 2018
- Program Committee Member – Demo Track**
ACM International Conference on Management of Data (SIGMOD), 2018
- 2017 **Program Committee Member**
SciPy Conference, 2017
- 2016 **Reproducibility Committee Member**
ACM International Conference on Management of Data (SIGMOD), 2016
- Artifact Evaluation Committee Member**
European Conference on Object-Oriented Programming (ECOOP), 2016

2015 **Reproducibility Committee Member**

ACM International Conference on Management of Data (SIGMOD), 2015

Artifact Evaluation Committee Member

European Conference on Object-Oriented Programming (ECOOP), 2015

2013 **Student Volunteer**

ACM International Conference on Management of Data (SIGMOD), 2013

Co-Organizer

Workshop on Software Infrastructure for Reproducibility in Science, Brooklyn, USA, 2013

Co-Organizer

Workshop on Reproducibility in Science, Brooklyn, USA, 2013

FREELY-AVAILABLE SOFTWARE SYSTEMS

Auctus

<https://gitlab.com/ViDA-NYU/datamart/datamart>

Auctus (or DataMart) is a dataset search engine tailored for data augmentation tasks in machine learning pipelines.

Data Polygamy

<https://github.com/ViDA-NYU/data-polygamy/>

Data Polygamy is a scalable topology-based framework that allows users to query for statistically significant relationships between spatio-temporal datasets.

ReproZip

<https://www.reprozip.org/>

ReproZip is a tool that automatically captures provenance of experiments and packs all the necessary files, library dependencies, and variables to reproduce the results. Reviewers can then unpack and run the experiments without having to install any additional software.

noWorkflow

<http://gems-uff.github.io/noworkflow/>

noWorkflow is a tool that can transparently capture detailed provenance information from Python scripts. It is non-intrusive, does not require users to change the way they work, and provides different ways to analyze the captured provenance.
